                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The nucleic acid encoding the chelon protein is useful for binding CC divalent mercuric ions, to take up, sequester and concentrate the heavy CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC immobilised onto a solid support, is useful for concentrating heavy metal colors from contaminated environment waste streams or contaminated CC aqueous medium including bhological fluids. The nucleic acid, when CC recombinantly expressed in enteric bacteria (which are nontoxigenic and CC elimination of mercuric ion from gastrointestinal tracts of animals or CC numers exposed to toxic metal ions such as mercury and/or cadmium. The CC molecules of the invention are also useful in water treatment resins. CC The nucleic acid of the invention is highly specific and binds divalent CC acid represents the adjacent plasmid region that encodes the variant Merr CC protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches 321;

ce recombinant DAR molecule comprising a sequence encoding a chelon protein for which binds mercuric ions. The invention is useful for recombinantly certification in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding cregion for the protein to produce a recombinant host cell and culturing the nucleic acid encoding the chelon protein is useful for binding certifications, to take up, sequester and concentrate the heavy divalent mercuric ions, to take up, sequester and concentrate the heavy irrigation water of waste streams. The DNA of the invention when certificated environment waster, hydroponic solutions or irrigation water of waste streams. The DNA of the invention when cerombinantly expressed in enteric bacteria (which are nontexispenic and concentration perspenic accombinantly expressed in enteric bacteria (which are nontexispenic and concentration of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The certification such as mercury or cadmium with high affinity. The present nucleic caid of the invention are also useful in water treatment resins. The nucleic acid of the invention with high affinity. The present nucleic certification of heavy metal binding proteins termed chelons.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is that of the haemolysin (hlyA) gene with two genes inserted into it, the cholera toxin subunit B gene (ctxB) and a mercury resistance gene (mer). It is used in the creation of a wishrio cholerae strain that has have 100% efficacy in protecting humans against subsequent infection with a strain of a similar serotype and avoid undesirable side effects such as diarrhoea, nausea and cramping. Cultures of these strains may be used for prodn. of vaccines against cholera. It is unclear whether the mer gene sequence is that of the sense or anti-sense strand as neither appears to have a clear reading frame. See also AAQ20185.

The patent discloses new packaging cell line for producing a viral cacessory protein independent lentivirus, preferably cell accessory protein independent lentivirus, preferably cell accessory protein independent lentivirus, preferably rector particles. The packaging cell line comprises a mammalian cell, a retroviral DNA comprising a coding sequence for a lentivirus, preferably HIV, gagpol, cell the coding sequence for a retroviral nucleotide sequence comprising the coding sequence for a heterologous envelope protein and a cell interest and lentivirus, preferably HIV, cis-acting sequence of cell interest and lentivirus, preferably HIV, cis-acting sequence for a heterologous envelope protein and a cell cell interest and lentivirus, preferably HIV, cis-acting sequences required for packaging cell lines and viral particles can be used for gene cell therapy or gene replacement with improved safety. They can also be used in the development and production of vaccines and blochemical reagents. The present sequence is a pol coding region of codon optimised HIV cell line. Codon optimisation results in improved expression of the gagpol protein and reduces the risk of recombination between the transfer cell line codon and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination between the transfer cell protein and reduces the risk of recombination protein and reduces the risk of recombination between the tra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC accessory protein independent lentivirus, preferably

CC human immunodeficiency virus (HIV), derived retroviral vector particles.

CC The packaging cell line comprises a mammalian cell, a retroviral DNA

CC comprising a coding sequence for a lentivirus, preferably HIV, gagpol,

CC where the coding sequence has been mutagenised to improve expression of

CC the viral gagpol proteins, a second retroviral nucleotide sequence

CC comprising the coding sequence for a heterologous envelope protein and a

CC interest and lentivirus, preferably HIV, cis-acting sequence of

CC interest and lentivirus, preferably HIV, cis-acting sequences required

CC The packaging, reverse transcription and integration.

CC The packaging cell lines and viral particles can be used for gene

CC therapy or gene replacement with improved safety. They can also be used

CC the present DNA is that of a packaging construct pHNMHgpm2 which

CC comprises a codon optimised HIV gagpol. The plasmid is defective for the

CC production of the viral envelope and accessory proteins e.g. tat, vif,

CC vpr, rev and Rev response element (RRE). It also lacks the viral

CC cell line.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chuman immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env. Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABR91449-ABR91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env, Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic Tlymphocyte (CTL) response against native HIV Env, Gag, Pol or Nef Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-AUG-2000; 2000US-225097P.

The nucleic acid molecule and its encoded protein (modified HIV Env. Gag. Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag. Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or ABCS1449-ABCS1624 represent modified HIV protein-encoding house the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the subsequent of the s

                                                          Modified HIV protein-encoding plasmid DNA #166.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env, Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTI) response against native HIV Env, Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or LTDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env, Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env, Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-AUG-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env, Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env, Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-AUG-2000; 2000US-225097P.

ACCESSION VERSION KEYWORDS COMMENT REFERENCE SOURCE DEFINITION AUTHORS TITLE JOURNAL ORGANISM Drosophila melanogaster genome survey sequence Sp6 end of BAC BACN37L08 of DrosBAC library from Drosophila melanogaster (fruit fly), genomic survey sequence.

AL108460
AL108460.1 GI:5628764
GSS. - Web: www.genoscope.cns.fr)

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP). http://www.edgp.ebi.ac.uk...This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector Drosophila melanogaster.

Drosophila melanogaster

Partially Hind III digested and size-selected S. mansoni cercarial DNA was ligated into Hind III digested pBeloBAC II vector and used to transform E. coll DH10B. The complete library contains 23808 clones from 4 independent sizing-ligation-transformations. Average insert size ranges from 70-127 kb and genome coverage is 7.9-fold.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          //OCTE—"Vector: lambdaZAP; Site_1: EcoR1; Site_2: Xho1; //OCTE—"Vector: lambdaZAP; Site_1)  
Plants were grown in the greenhouse at the University of California, Riverside (Fenton, SJ Close, TJ Close). Whole spikes with awns trimmed were collected at 5, 10, 15, 20, 30 and 45 DAP (Fenton). Total RNA was prepared from each pool, equal quantities of all six RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi)in the TJ Close lab at the University of California, Riverside. Phagemids were plated and picked at the Clemson Prisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of bired value 20 or above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence analysis see http://www.genome.clemson.edu/projects/barley.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            xhoI; This library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites. PBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

QΥ
                                                                                                                                  The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a CC oligonucleotide which comprises a 3'-end sequence, where the CC oligonucleotide which comprises a 3'-end sequence, where the CC the 5'-end sequence/3'-end sequence is selected from those defined in CC in gene therapy. The primers sets can be used in antisense therapy and CC particularly full-length cDNAs. The primers are useful for synthesising polynucleotides, CC detection and/or diagnosis of the abnormality of the proteins encoded by CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB1563 to AAH13674 represent human cDNA sequences; and AAH13628 and CC AAB1563 and AAH1363 to AAH13628 and AAH1363 to AAH13628, all of which are used in the exemplification of the present human cnown sequences; and AAH13629 to AAH13632 of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc polymerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques cc for identifying expressed genes. (I) is useful in gene therapy techniques cc (II). (II) is useful for generating antibodies against it, detecting or creating a polypeptide in tissue, as molecular weight markers and as cc quantitating a polypeptide in tissue, as molecular weight markers and as cc quantitating of sites expressing (II). (I) and (II) are useful for treating cc disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cc diagnostics, forensics, gene mapping, identification of mutations cc and to produce other types of data and products dependent on DNA and camino acid sequences. As54197-AAS94564 represent novel human cc diagnostic coding sequences of the invention.

Cc specification, but was obtained in electronic format directly from WIPO at format of information in formations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  뭥
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ARK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM62170 to AAM91921. (I) have cytostatic c activity, and can be used in gene therapy and vaccine production. (I) createns and polynucleotides may be used in the prevention, diagnosis and c treatment of diseases associated with inappropriate (I) expression. For c example, they may be used to treat disorders associated with decreased c that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) c polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the c protein. (I) proteins and polynucleotides may be used to prevent, c diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic diseases, especially c to AAK87694 represent human immune/haematopoietic antigen genomic c sequences from the present invention. AAK34942 to AAK34950 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
Best Local (
polypeptide (II) sequences. (I) is useful as hybridisation probes.
                                                      Claim 1; SEQ ID No 18114; 103pp; English.
                                                                                                   New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -
                  The invention relates to isolated polynucleotide (I) and

                                                                                                                                                                                                                                                                                                                                                                                                                  cc which binds mercuric ions. The invention is useful for recombinantly cc which binds mercuric ions. The invention is useful for recombinantly cc cell capable of expressing a chelon coding sequence with a vector cc comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding cc make the protein to produce a recombinant host cell and culturing cc metal ions from contaminated soil, ground water and concentrate the heavy cc irrigation water of waste streams. The DNA of the invention, when cc immobilised onto a solid support, is useful for concentrating heavy metal considered environment waste streams or contaminated concentrated available for use in the invention and cc nonpathogenic), is suitable for use in the in vivo sequestration and cc endimination of mercuric ion from gastrointestinal tracts of animals or cellmination of the invention are also useful in water treatment resins. The nucleic acid of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent caid sequence represents synthetic product 1 forward PCR primer that was used in the methods of the invention for construction of pask-MBD vector.
                                                                                                                                                                                                                                                                                           밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The nucleic acid encoding the chelon protein is useful for binding divalent mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or inmobilised onto a solid support, is useful for concentrating heavy metal ions from contaminated environment waste streams or contaminated onto a solid support, is useful for concentrating heavy metal ions from contaminated environment waste streams or contaminated aqueous medium including biological fluids. The nucleic acid, when recombinantly expressed in enteric bacteria (which are nontoxigenic and elimination of mercuric ion from gastrointestinal tracts of animals or metal acid.) is suitable for use in the in vivo sequestration and elimination of mercuric ion from gastrointestinal tracts of animals or metal acid.

                                                                                                                                                                                                                                                                                                                                                                                                         humans exposed to toxic metal ions such as mercury and/or cadmium. The molecules of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present nucleic acid sequence represents synthetic product 2 forward PCR primer that was used in the methods of the invention for construction of pASK-MBD vector.
                                                                                                  AAQ58554 standard; DNA; 568 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed.
                                                                                                                                                                                                                                                                                                                                                                           Sequence 30 BP; 7 A; 11 C; 8 G; 4 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel non-naturally occurring recombinant DNA molecule encoding a chelon protein useful for binding divalent cation mercury from contaminated soil, water, aqueous medium including biological fluids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 24; 42pp; English.

Synthetic product 2 forward PCR primer for construction of pASK-MBD

Ħ ABK52210 RESULT 8

ABK52210 standard; DNA; 30 BP

```
CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC immobilised onto a solid support, is useful for concentrating heavy metal CC ions from contaminated environment waste streams or contaminated CC caqueous medium including biological fluids. The nucleic acid, when CC recombinantly expressed in enteric bacteria (which are nontoxigenic and CC compathogenic), is suitable for use in the in vivo sequestration and CC elimination of mercuric ion from gastrointestinal tracts of animals or CC elimination of mercuric ion from such as mercury and/or cadmium. The CC molecules of the invention are also useful in water treatment resins.

CC molecules of the invention are also useful in water treatment resins.

CC cation such as mercury or cadmium with high affinity. The present nucleic cation such as mercury or cadmium with high affinity. The present nucleic acid sequence represents synthetic product 1 reverse PCR primer that was CC used in the methods of the invention for construction of pASK-MBD vector.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding divalent mercuric ions, to take up, sequester and concentrate the heavy divalent mercuric ions, to take up, sequester and concentrate the heavy

CC divalent mercuric ions, to take up, sequester and concentrate the heavy contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when consisted environment waste streams or conteminated contaminated environment waste streams or contaminated consistent including biological fluids. The nucleic acid, when creaming the pressed in enteric bacteria (which are nontoxigenic and CC enumantion of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The nucleic acid of the invention are also useful in water treatment resins. CC molecules of the invention are also useful in water treatment resins. CC cation such as mercury or cadmium with high affinity. The present nucleic acid sequence encodes the Shigella flexneri wild-type Merk protein of the convention. This sequence was used in the methods of the invention for the production of heavy metal binding proteins termed chelons.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of the haemolysin (hlyA) gene with two genes inserted into it, the cholera toxin subunit B gene (ctxB) and a mercury resistance gene (mer). It is used in the creation of a Vibrio cholerae strain that has have 100% efficacy in protecting humans against subsequent infection with a strain of a similar serotype and avoid undesirable side effects such as diarrhoea, nausea and cramping. Cultures of these strains may be used for prodn. of vaccines against cholera. It is unclear whether the mer gene sequence is that of the sense or anti-sense strand as neither appears to have a clear reading frame. See also AAQ20185.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Fig 21; 83pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABK52213 standard; DNA; 509 BP.
The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                              18-APR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200230962-A2.

CC The nucleic acid encoding the chelon protein is useful for binding CC divalent mercuric ions, to take up, sequester and concentrate the heavy CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC inmobilised onto a solid support, is useful for concentrating heavy metal CC ions from contaminated environment waste streams or contaminated CC elementary expressed in enteric bacteria (which are nontoxigenic and CC elementary), is suitable for use in the in vivo sequestration and CC elimination of mercuric ion from gastrointestinal tracts of animals or CC elimination of mercuric ion from gastrointestinal tracts of animals or CC elimination of the invention are also useful in water treatment resins. CC molecules of the invention are also useful in water treatment resins. CC cation such as mercury or cadmium with high affinity. The present nucleic cation such as mercury or cadmium with high affinity. The present nucleic cation for the invention are defined that encodes the variant MerR corrects of the invention are the invention of the invention of the invention are also useful in water treatment resins.

cc divalent mercuric ions, to take up, sequester and concentrate the heavy cc metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when cc immobilised onto a solid support, is useful for concentrating heavy metal cons from contaminated environment waste streams or contaminated cc aqueous medium including biological fluids. The nucleic acid, when cc recombinantly expressed in enteric bacteria (which are nontoxigenic and cc recombinantly expressed in enteric bacteria (which are nontoxigenic and cc nonpathogenic), is suitable for use in the in vivo sequestration and cc elimination of mercuric ion from gastrionitestinal tracts of animals or compathogenic acid of texts metal ions such as mercury and/or cadmium. The cc molecules of the invention are also useful in water treatment resins. Cc cation such as mercury or cadmium with high affinity. The present nucleic caid sequence encodes the synthetic Merk chelon variant protein of the content of the invention. This sequence encodes one of the heavy metal binding proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches 321;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which blinds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding the chelon protein is useful for binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 21; 42pp; English.

cc recombinant DAR molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly cc which binds mercuric ions. The invention is useful for recombinantly cc producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding the comprising a promoter active in the host cell operably linked to a coding the recombinant host cell and culturing compressed. The nucleic acid encoding the chelon protein is useful for binding complete the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding complete the neavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when combinantly expressed in enteric bacteria (which are nontoxigenic and concenting including biological fluids. The nucleic acid, when completogenic), is suitable for use in the in vivo sequestration and completogenic), is suitable for use in the in vivo sequestration and completogenic), is suitable for use in the invito sequestration and completogenic), is suitable for use in the invito sequestration and completogenic), is suitable for use in the invito sequestration and completogenic acid of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent completogenic and enteric bacteria (which are present nucleic convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABK52212
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 2

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                        merA gene; merR gene; merT gene; mercuric reducta
Plasmid NR1 (IncFII) from E.coli DNA, clone pDB7.
Plasmid NR1
           praft entry and sequence in computer readable form for [2] kindly provided by A.O.Summers, 15-SEP-1986. Potential Shine-Dalgarno sequences are located at positions 157-162 (13.1 kd), 590-596 (12.4 kd), 1740-1745 (59 kd) and 545-542 (15.9 kd). A single 38 bp inverted repeat, which delimits the leftward end of Tn21. Tn4 and Tn501 extends from nucleotide 65-102. A promoter region for the structural genes is located between positions 366-885. This area contains regions of dyad symmetry which might function as operator. Sites for mark, which negatively regulates the expression of the
                                                                                                                                                                                                                                                                                                The DNA sequence of the mercury resistance operon of the IncFII plasmid {\tt NR1}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NRIMER Plasmid NRI mercury resistance (mer) operon.

The 12.4 kd and 15.0 kd predicted peptides are located in the inner membrane and have no detectable precursors. The 9.4 kd peptide is soluble, is processed to a 12 kd form and is for the most part associated with the periplasm. The first 30 bases were replaced with the corrected sequence from [2]. The rest of the revisions are in the sites table.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cause loss of translocation activity.

Three R100 derived small circular plasmids (pSM1, pSM2, pSM5) from the R100 derived small circular plasmids (pSM1, pSM2, pSM5) from the same as pSM2, except for a ISIR) in circularized form. pSM1 is the same as pSM2, except for a psychological part of the same as pSM2, except for a perfect of the same psychological properties and psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psychological psycholog
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence for [3], [5] and [4] kindly provided on tape by T.K.Misra. Isl from [1] was renamed ISlR after [2] discovered that there are several ISl iso-insertion sequences. The 5' and 3' ends of ISlR are approximate inverted repeats. [2] found the CDS regions annotated below conserved among several ISls. Deletion mutations in either of these two coding frames or in the two ends of ISlR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Unpublished
